

Week 7 Analytics Testing & Refinement Report

HealthConnect Clinic Analytics | AnalystLab Africa | Week 7

Executive Summary

Week 7 focuses on validation and refinement of the Week 6 decision-support analysis. Existing findings are reported below, while Power BI tests affected by DAX instability are explicitly marked pending.

Findings

Attendance rate: 46.28%. Overall no-show rate: 48.46%. Cancelled appointments: 5.26%.

No-show rate among Attended versus No-show records only: approximately 51.15%.

Follow-up no-show rate: 51.23%.

Overall reminder-channel rates: Email 48.41%; No Reminder 51.39%; SMS 45.75%; WhatsApp 49.77%.

Previous no-show history appears relevant, but extreme groups require sample-size verification.

Recommendations

Target patients with repeated no-show history.

Improve reminder data completeness.

Compare reminder channels within appointment types.

Standardize KPI denominator definitions.

Treat distance and waiting time as exploratory rather than established drivers.

Validation Status

Outcome reconciliation, percentage reconciliation, Follow-up filter testing, and dashboard-to-source verification remain pending because the DAX measures caused the Power BI table to become unstable.

No successful test result is claimed without Power BI evidence.

Limitations

The analysis is observational, affected by missing values and differing treatment of cancelled appointments, and is not a production predictive model.
