

Week 7 Cross-Track Collaboration

HealthConnect Clinic Analytics | AnalystLab Africa | Week 7

Purpose

Document the aligned interpretation between Analytics and Data Science.

Collaboration Findings

Analytics retained cancelled appointments in the primary dataset, while Data Science excluded 263 cancelled appointments before comparing Attended versus No-show outcomes.

Analytics reported 1,633 missing reminder-channel values in its latest analysis; Data Science reported 1,285. The difference is partly explained by different analysis populations and cancelled-appointment treatment.

Data Science observed a smaller reminder-related difference of approximately five percentage points, supporting a cautious, non-causal interpretation.

Next Steps

Use a shared population definition, common outcome taxonomy, consistent missing-value treatment, and aligned KPI formulas.
